

README

SMART PARKING SYSTEM

GROUP 12

Backend Part

1. Install nodeJs on your machine. You can get it from [here](#).
2. Open one terminal instance and goto the directory where app.js and fire.js files exist.
3. Type npm init in one of the terminals and let it run.
4. Make sure port 4000 is not in use. You can kill the process if the port is busy using the two commands.
 - a. `sudo lsof -i :4000`
 - b. `kill -9 <PID>`
5. Now type node app.js in the terminal and run it.
6. On the terminal(app.js), two lines should pop up, i.e., `server started!!` And the `database connected!!`. If these two lines don't popup, there must be some problem.
7. Now you can go to '<http://localhost:4000>' on your browser.

The website is live NOW

- For any other problem please contact us as any unexpected problem may come.
- Please use a personal network(not use proxy network), as clouinary doesn't work on proxy networks.
